Assignment 5.1: Written, Oral and Graphical Communication

1. Should an engineer also be good in written communication?

Yes, because engineering work is only as useful as it is understood by others, and much of it is made in writing technical reports, specifications, proposals, emails, manuals, and project documentations. A good design that is poorly explained can be misread, misused, or rejected, leading to costly errors or even safety risks. Written communication also creates a permanent record, so that decisions, requirements, and test results can be reviewed and verified after the discussion has ended. Engineers who can write clearly and concisely are better able to persuade clients and managers, collaborate with teams, and improve their own careers.

2. Oral communication vs. engineering graphical communication

Oral communication uses spoken words, tone, and body language to share ideas at live performance, such as in meetings, presentations, or site briefings. It is flexible and allows immediate feedback and clarification, but it is temporary and open to different interpretations. While Engineering graphical communication, uses standardized visual tools like technical drawings, schematics, diagrams, CAD models, codes, and charts to convey precise dimensions, structures, and relationships. It follows fixed conventions and symbols, it leaves little room for ambiguity and can be understood across languages, which makes it essential for manufacturing, construction, and circuit or system design.

3. Justifying "Communication is the key" in the workplace

As a future engineer, I believe this phrase is true because no engineering project is done alone, any project involves teammates, supervisors, clients, technicians, and other members who must all share the same understanding of goals, requirements, and challenges. Clear communication prevents misunderstandings that cause delays, rework, budget overruns, and safety hazards. It also builds trust and teamwork, since people are more willing to cooperate and share ideas when they feel heard. Lastly, technical skill alone is not enough, an engineer who can explain ideas clearly, listen to feedback, and coordinate with others turns individual knowledge into results that will benefit the whole team and project itself.
